

The Logic of Events, a framework to reason about distributed systems

Mark Bickford, Vincent Rahli, Robert Constable

Cornell University and ATC-NY

January 24, 2012

Summary

We have :

- ▶ A logical specification language (the logic of events) that formalizes the message sequence diagrams systems engineers use.
- ▶ A logical and compositional abstraction (event classes) from which we can synthesize code.
- ▶ A language (EventML) for defining event classes and their high-level properties.
- ▶ Automated tools that prove invariants and derive “inductive logical forms” that streamline the proofs of distributed algorithms.
 - ▶ In two days we now construct proofs of agreement and validity properties of a consensus algorithm.
 - ▶ Those proofs used to take a month to create.

Proofs as programs \rightarrow Proofs as processes

- ▶ Programs are the evidence for Propositions.

Proofs as programs \rightarrow Proofs as processes

- ▶ Programs are the evidence for Propositions.
- ▶ Event ordering = $\langle E, loc(e), info(e), e_1 < e_2 \rangle +$ six axioms
- ▶ Event Logic = propositions in CTT about event orderings
- ▶ Evidence ?? could be IO-Automata, π -calculus, ...

Event class: the link to computation

An event class X of type $class(T)$ is both

- ▶ A relation $v \in X(e)$
 - ▶ X observes v at event e
 - ▶ X associates information v with event e
- ▶ A function $X : EO \rightarrow E \rightarrow \text{Bag}(T)$

Event class: the link to computation

An event class X of type $class(T)$ is both

- ▶ A relation $v \in X(e)$
 - ▶ X observes v at event e
 - ▶ X associates information v with event e
- ▶ A function $X : EO \rightarrow E \rightarrow \text{Bag}(T)$
- ▶ $v \in Base(hdr, type)(e) \Leftrightarrow info(e) = \langle hdr, type, v \rangle$

Example: consensus safety properties

Agreement

If commands c and c' are chosen for the n^{th} command then $c = c'$.

$$\begin{aligned} \forall e_1, e_2 : E. \quad \forall n : \mathbb{Z}. \quad \forall c, c' : \text{Cmd}. \\ \langle n, c \rangle \in \text{notify}'\text{base}(e_1) \\ \Rightarrow \langle n, c' \rangle \in \text{notify}'\text{base}(e_2) \\ \Rightarrow c = c' \end{aligned}$$

Validity Any command decided on must have been proposed.

$$\begin{aligned} \forall e : E. \quad \forall n : \mathbb{Z}. \quad \forall c : \text{Cmd}. \\ \langle n, c \rangle \in \text{notify}'\text{base}(e) \\ \Rightarrow (\exists e' : E. (e' < e) \wedge \\ \langle n, c \rangle \in \text{propose}'\text{base}(e')) \end{aligned}$$

Event class combinators

(used here to structure 2/3 majority consensus algorithm)

`main` = `Replica @ locs`

`Replica` = `NewVoters >>= \p. Voter p`

Event class combinators

(used here to structure 2/3 majority consensus algorithm)

```
main                = Replica @ locs

Replica             = NewVoters >>= \p.Voter p

Voter (n,c)         = Round ((n,0),c)
                    || (Notify n)
                    || ((NewRounds n >>= Round)
                        until (Notify n))

Round (ni ,c)       = SendVotes (ni ,c)
                    || Once(Quorum ni)
```

Event classes and combinators are expressible in EventML.

Computation and logic

Event classes have two facets:

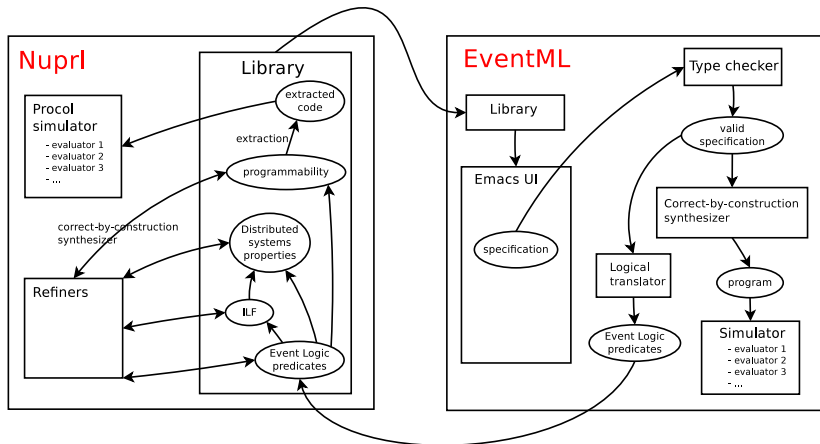

- ▶ **computational:**

- ▶ they can be implemented as processes (tail recursive)
- ▶ program for each combinator derived from constituent programs
- ▶ all constructions proved correct in Nuprl
- ▶ result: a verified code synthesizer from event classes to processes

- ▶ **logical:**

- ▶ they specify information flow (using the class relation)
- ▶ relation for each combinator derived from constituent relations
- ▶ derived relations proved correct in Nuprl
- ▶ result: a verified translator from event classes to logical relations

Cooperation with a Logical Programming Environment (LPE)

EventML prelude

```
specification rsc4
```

```
(* ——— PARAMETERS ——— *)
```

```
(* consensus on commands of arbitrary type Cmd with equality decider *)
```

```
parameter Cmd, cmdeq : Type * Cmd Deq
```

```
parameter coeff      : Int
```

```
parameter flrs       : Int (* max number of failures *)
```

```
parameter locs       : Loc Bag (* set of exactly (3 * flrs + 1) locations *)
```

```
parameter clients    : Loc Bag (* locations of the clients to be notified *)
```

```
(* ——— CONSTANTS ——— *)
```

```
import length poss-maj list-diff deq-member from-upto Memory-class
```

```
int-list-member
```

```
(* ——— TYPE FUNCTIONS ——— *)
```

```
type Inning = Int
```

```
type CmdNum = Int
```

```
type CI      = CmdNum * Inning
```

```
type CC      = CmdNum * Cmd
```

```
type Vote    = (CI * Cmd) * Loc
```

```
(* ——— INTERFACE ——— *)
```

```
internal vote      : Vote
```

```
internal retry     : CI * Cmd
```

```
internal decided   : CC
```

```
output  notify     : CC
```

```
input   propose    : CC
```

EventML

```
(* — inputs — *)
let vote2prop loc (((n,i),c),loc') = {(n,c)} ;;
class Proposal = propose'base || (vote2prop o vote'base) ;;

(* — output — *)
let when_new_proposal loc (n,c) (max,missing) =
  if n > max or deq-member (op =) n missing then {(n,c)} else {} ;;

(* — update — *)
let update_replica (n,c) (max,missing) =
  if n > max
  then (n, missing ++ (from-upto (max + 1) n))
  else if deq-member (op =) n missing
  then (max, list-diff (op =) missing [n])
  else (max,missing) ;;

(* — New votes state — *)
class ReplicaState = Memory-class update_replica (init (0,nil)) Proposal ;;

(* — New votes observer — *)
class NewVoters = when_new_proposal o (Proposal , ReplicaState) ;;

(* — Replica — *)
class Replica = NewVoters >>= Voter ;;

(* — Main program — *)
main Replica @ locs ;;
```

EventML assertions

```
(* — state — *)  
class ReplicaState = Memory-class update_replica (init (0, nil)) Proposal ;;  
  
(* — invariants — *)  
invariant replica_inv on (max, missing) in ReplicaState  
  == max >= 0  
  /\ forall x : Int, int-list-member x missing => max > x /\ x > 0;;
```

Automated tactics prove many assertions automatically.

Inductive logical form (ILF)

automatically generated, automatically proved

$$\begin{aligned} & \forall[\text{Cmd:ValueAllType}]. \forall[\text{clients:bag}(\text{Id})]. \forall[\text{cmdeq:EqDecider}(\text{Cmd})]. \forall[\text{coeff,flrs}:\mathbb{Z}]. \forall[\text{locs:bag}(\text{Id})]. \\ & \forall[\text{es:E0}']. \forall[\text{e:E}]. \forall[\text{rcvr:Id}]. \forall[\text{num,rnd}:\mathbb{Z}]. \forall[\text{c:Cmd}]. \forall[\text{sndr:Id}]. \\ & (\langle \text{rcvr}, \text{rsc4_vote}'\text{msg}(\text{Cmd}; \langle \langle \text{num}, \text{rnd} \rangle, \text{c} \rangle, \text{sndr}) \rangle \in \text{rsc4_Main}(\text{e})) \\ & \iff \text{loc}(\text{e}) \in \text{locs} \\ & \quad \wedge (\text{rcvr} \in \text{locs} \wedge (\text{sndr} = \text{loc}(\text{e}))) \\ & \quad \wedge (\exists \text{e}':\{\text{e}':\text{E} \mid \text{e}' \leq_{\text{loc}} \text{e}\} \\ & \quad \quad ((\exists \text{max}:\mathbb{Z} \\ & \quad \quad \quad \exists \text{missing}:\mathbb{Z} \text{ List} \\ & \quad \quad \quad (\langle \text{max}, \text{missing} \rangle \in \text{rsc4_ReplicaState}(\text{Cmd})(\text{e}') \wedge ((\text{max} < \text{num}) \vee (\text{num} \in \text{missing})))))) \\ & \quad \wedge (\exists \text{c}':\text{Cmd} \\ & \quad \quad (((\text{e} = \text{e}') \wedge (\text{c} = \text{c}') \wedge (\text{rnd} = 0)) \\ & \quad \quad \vee ((\exists \text{e}1:\{\text{e}1:\text{E} \mid \text{e}1 \leq_{\text{loc}} \text{e}\} \\ & \quad \quad \quad ((\exists \text{maxr}:\mathbb{Z}. (\text{maxr} \in \text{rsc4_NewRoundsState}(\text{Cmd}) \text{ num}(\text{e}1) \wedge (\text{maxr} < \text{rnd}))) \\ & \quad \quad \quad \wedge (\langle \langle \text{num}, \text{rnd} \rangle, \text{c} \rangle \in \text{rsc4_retry}'\text{base}(\text{Cmd})(\text{e}1) \\ & \quad \quad \quad \vee (\exists \text{sndr}':\text{Id}. \langle \langle \text{num}, \text{rnd} \rangle, \text{c} \rangle, \text{sndr}' \rangle \in \text{rsc4_vote}'\text{base}(\text{Cmd})(\text{e}1)))) \\ & \quad \quad \quad \wedge (\text{e} = \text{e}1)))) \\ & \quad \quad \wedge (\text{no rsc4_Notify}(\text{Cmd}; \text{clients}) \text{ num between } \text{e}' \text{ and } \text{e}))) \\ & \quad \wedge (\langle \text{num}, \text{c}' \rangle \in \text{rsc4_propose}'\text{base}(\text{Cmd})(\text{e}')) \\ & \quad \vee (\exists \text{rnd}':\mathbb{Z}. \exists \text{sndr}':\text{Id}. \langle \langle \text{num}, \text{rnd}' \rangle, \text{c}' \rangle, \text{sndr}' \rangle \in \text{rsc4_vote}'\text{base}(\text{Cmd})(\text{e}')))))))) \end{aligned}$$

Conclusion

The right abstractions, embedded in a language that can interface with automated theorem provers gives us the ability to synthesize code that provably satisfies high-level specifications.
